Tools and Methods for Multimodal Annotation: the OTIM Project

Philippe Blache

Laboratoire Parole et Langage CNRS & Université de Provence

Programme

Monday, May 23rd	
9h15-9h45	General presentation Philippe Blache
9h45-10h30	Primary data : Transcription, Alignment, Methodology Robert Espesser, Brigitte Bigi
11h-11h45	Automatic annotations: tools, results Stéphane Rauzy et Daniel Hirst
11h45-12h30	Manual annotations: overview Roxane Bertrand, Béatrice Priego-Valverde
13h45-14h45	Manual annotations: Disfluencies, Discourse, Gestures Laurent Prévot, Ning Tan, Gaëlle Ferré, Marion Tellier
14h45-15h15	Illustration: Backchannels, Reinforcing gestures Gaëlle Ferré, Roxane Bertrand
15h15-16h	Coding scheme and XML Philippe Blache, Julien Seinturier
16h15-17h	Querying multiple documents Elisabeth Murisasco, Emmanuel Bruno, Julien Seinturier

Programme

9h30-10h15 Harry Bunt, Tilburg University ISO/DIT dialogue annotation and its semantics Nancy Ide, Vassar College The Open American National Corpus: An Interoperable, Open Collaborative Annotation Project Christopher Cieri, UPenn, LDC Language Resources for ? Outline

- The OTIM Project: general overview
- Multimodal annotations: a life-size experiment
- The formal background

Part I

The OTIM Project: General Overview

OTIM: Outils pour le Traitement de l'Information Multimodale

- Multimodal annotation
 - Different modalities
 - Different domains: phonetics, prosody, syntax, pragmatics, etc.

Goals

- Description of modalities and their interaction
- Analysis of natural communication

Questions

- Generality: annotation reusability
- Representation, encoding
- Alignment vs. synchronization
- Diversity of annotation tools and formats
- Data manipulation, querying

Method

- Rich annotation for each domain
- Stand-off, independent annotations
- Homogeneous representation

Multimodal Corpora: a survey

- Switchboard in NXT project
 - 642 conversations, 830,000 words.
 - Syntax, turns, disfluency, information status, coreference, phonemes, syllables, prosodic phrases, breaks, accents
- LUNA (Spoken Language Understanding in Multilingual Communication Systems)
 - 8100 human-machine dialogues and 1000 human-human dialogues in Polish, Italian and French.
 - Turns, POS, chunks, dialogue acts, reference
- SAMMIE (Saarbrücken Multimodal MP3 Player Interaction Experiment)
 - Multimodal dialogue system, human-machine multimodal interaction (Wizard of Oz)
 - Transcription, turns, clauses, discourse entities, dialogue acts

Multimodal Corpora: a survey

- AMI (Augmented Multi-party Interaction)
 - 100h meeting, full manual transcription
 - Dialogue acts, focus of attention, movement (hand, head, leg), named entities, topic segmentation

The ITC Corpus

- 11 groups of 4 people (25 minutes each). Task: decision making scenario
- No transcription, functional role, socio emotional, speech activity, body activity

The ATR Corpus

- 10 meetings, 1 hour each
- No transcription, speech activity, body movements, activity type

Part II

Multimodal Annotation: a Life-size Experiment

A life-size experiment: CID (Corpus of Interactional Data)

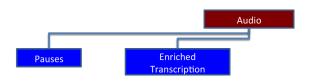

- 8 dialogs, 1 hour each (4 male/male; 4 female/female)
- Task: tell something unusual which happened to you tell about professional conflicts you may have met
- Setting
 - Anechoic room
 - 1 camcorder / 2 microphones
- Annotations (aligned on the signal)
 - Phonetic and orthographic transcription
 - Prosody (units, intonation, contours)
 - Morphosyntax, syntax
 - Discourse (markers, turns, etc.)
 - Gestures

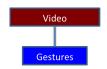

Illustration

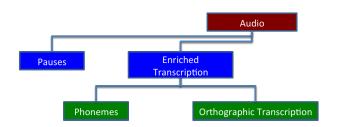

Illustration

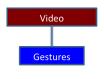

The Annotation Architecture

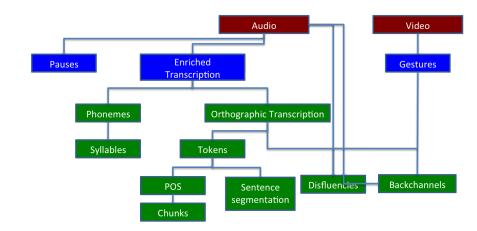

The Annotation Architecture

The Annotation Architecture

Main steps and contributions

- Primary Data Preparation
 - Transcription: Enriched Transcription Convention <<< OTIM
 - Generation of orthographic and phonetic transcriptions
 - Aligning transcriptions with the signal <<< OTIM
- 2 Automatic Annotation
 - Syllabification <<< OTIM
 - Intonation
 - Sentence segmentation <<< OTIM
 - POS-tagger
 - Chunker

Main steps and contributions

- Manual Annotation <<< OTIM</p>
 - Gestures: hands, head, arms
 - Prosody: phrasing, contours, intonation
 - Disfluences
 - Discourse: turns, backchannels, reported speech, information structure
 - Syntax: detachments
- Formal representation, data
 - Abstract schema: Typed Feature Structures <<< OTIM
 - Generation of the XML schema <<< OTIM
 - Formatting data
 - Querying

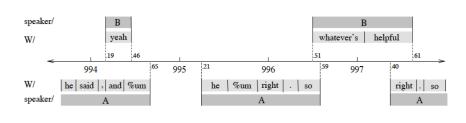

Some descriptions

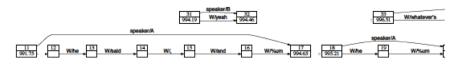

- Backchannels <<< OTIM</p>
 - Vocal and gestural
 - Description in terms of prosody, discourse, morpho-syntax
- 2 Detachments <<< OTIM</p>
 - Dislocation, cleft, topicalization
 - Annotation of the detachment type, the category, the function, the anaphor

Part III

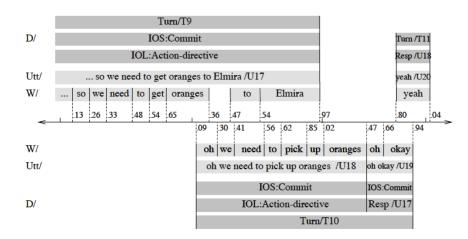

The Formal Background

Annotation Graphs

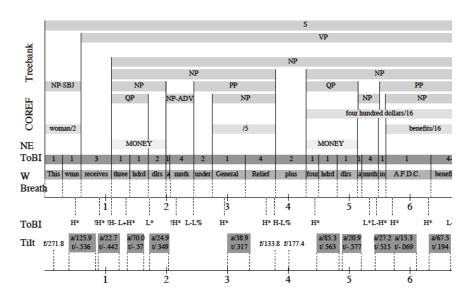

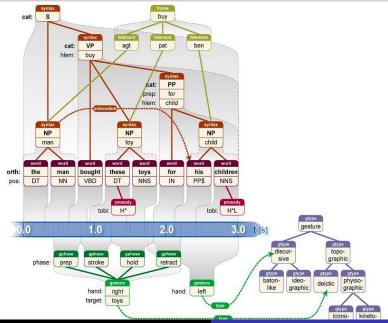

Annotation Graphs

Annotation Graphs

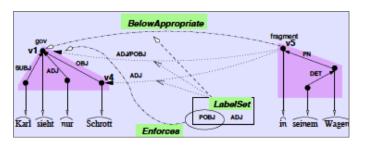

NITE XML Toolkit (NXT)

Graph Annotation Format (GrAF)

- GrAF: nodes and edges, decorated with feature structures
- Annotations label nodes (rather than edges as in AG)
- Nodes may be linked to:
 - Primary data
 - Other nodes in the graph

Graph Annotation Format (GrAF)

Base segmentation:

```
<seg:sink seg:id="42" seg:start="24" seg:end="35"/>
```

Annotation over the base segmentation:

Annotation over another annotation:

Discussion

Problems

- Some referential objects are not aligned with the signal
 - Concrete objects (the objects of the scene)
 - Abstracts referents (ideas, concepts, etc.)
- Some phenomena are not synchronized (e.g. deictic gestures)

Elements of answer

- Different anchors: time, spatial, index
- An annotation is described by its properties and its anchor
- A construction is a set of annotations, not necessarily ordered

Formally

- A construction is an hypergraph
- Nodes are annotations
- Nodes and edges are labelled with feature structures

Discussion

Problems

- Some referential objects are not aligned with the signal
 - Concrete objects (the objects of the scene)
 - Abstracts referents (ideas, concepts, etc.)
- Some phenomena are not synchronized (e.g. deictic gestures)

Elements of answer

- Different anchors: time, spatial, index
- An annotation is described by its properties and its anchor
- A construction is a set of annotations, not necessarily ordered

Formally

- A construction is an hypergraph
- Nodes are annotations
- Nodes and edges are labelled with feature structures

Discussion

Problems

- Some referential objects are not aligned with the signal
 - Concrete objects (the objects of the scene)
 - Abstracts referents (ideas, concepts, etc.)
- Some phenomena are not synchronized (e.g. deictic gestures)

Elements of answer

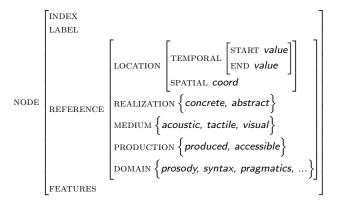

- Different anchors: time, spatial, index
- An annotation is described by its properties and its anchor
- A construction is a set of annotations, not necessarily ordered

Formally

- A construction is an hypergraph
- Nodes are annotations
- Nodes and edges are labelled with feature structures

Nodes

- Index: absolute reference to the node
- Reference: description of the general characteristics
- Features: description of the linguistic properties

Edges

```
\begin{bmatrix} \text{INDEX} \\ \text{LABEL} \\ \text{DOMAIN} \left\{ \textit{prosody, syntax, pragmatics, } \ldots \right\} \\ \text{RELATION} \\ \begin{bmatrix} \text{REL\_TYPE} \\ \text{SET\_REL} \left\langle \textit{node list} \right\rangle \end{bmatrix} \\ \text{ALIGNMENT} \left\{ \textit{strict, fuzzy} \right\} \end{bmatrix}
```

Part IV

Results Presentation

Results Presentation

Transcription, phonetization, alignment

Robert Espesser and Brigitte Bigi

Automatic annotations: tools, results

Stéphane Rauzy and Daniel Hirst

Manual annotations: overview

Roxane Bertrand and Béatrice Priego-Valverde

Manual annotations: disfluencies, discourse, gestures

Laurent Prévot, Ning Tan, Gaëlle Ferré, Marion Tellier

Illustration: backchannels, beinforcing gestures

Gaëlle Ferré and Roxane Bertrand

Coding scheme and XML

Philippe Blache and Julien Seinturier

Querying multiple documents

Elisabeth Murisasco, Emmanuel Bruno, Julien Seinturier
